Introduction

POPnotary is a remote online notarization software. It allows you to offer your consumers notary services through your Support Center. Representatives who are commissioned notaries perform notarizations during video calls. *POPnotary* includes:

- Notary profiles for each commissioned rep. The reps must upload all certifying documentation to their Support Center profile. The system helps notaries manage the documentation and certification, as well.
- Notarization tasks during WorkFlows. Notaries perform the notarization through one-off WorkFlows during video calls , or you can create notary templates for commonly-notarized documents.
- Notary journals for each notary. Notaries are required to keep journals to document each notarization. The system maintains each notary's journal by providing details of notarizations that they've performed.

Note:

States expect notaries to do their own research and education to comply with local laws and standards. *POPnotary* is a tool that enables and supports notaries in performing notarizations. Eltropy does not provide training on how to be a notary. Eltropy does, however, obtain certification from states to offer *POPnotary*, and maintains each states' requirements on notary certification. For self-education, the [National Notary Association](#) provides training material.

System Requirements

States require a high level of certification and regulation to perform notarizations. Therefore, *POPnotary* requires several features to be enabled in your system in order to comply. For example, you must ensure a higher security standard for both your reps and consumers. The following lists the required features to comply with state standards:

- **Recording** - both audio and video of all notarizations must be recorded. These recordings are part of the notary data that is retained for 10 years.
- **Multi-factor Authentication (MFA)** - this requires your reps to enter a code when signing into your system. MFA adds a second layer of security to ensure that only your commissioned reps are performing notarizations. This is a system-wide setting, which requires all employees to sign in with MFA, not only your designated notaries.
- **POPverify** - this is to ensure that your consumers are who they say they are. *POPverify* requires consumers to prove their identity with a driver's license ID scan, plus correctly answering a series of knowledge-based questions. These verification steps occur as part of the notarization Workflow.

Contact your CSM about enabling these features.

Notary Certification Requirements

To perform notarizations, your reps must be commissioned and certified by their state government. POPi/o does not provide certification, therefore all necessary certificates must be attained by the individual notary. POPi/o does, however, assist in tracking and maintaining all documentation in the notary's user profile. To be certified, the notary must acquire the following items:

- State notary commission certificate
- Notary bond
- Notary insurance
- Notary eSeal
- Digital signing certificate through IdenTrust™ (minimum of a basic assurance certificate)

The notary must upload these items to their profile before performing notarizations. These certifications are valid for several years depending on certificate type and jurisdiction. If a certificate is approaching its expiration date, the system notifies the notary of the upcoming expiration.

Eltropy partnered with IdenTrust™ to provide your notaries with a digital signing certificate. IdenTrust™ is a renowned provider of these certificates, and offers their services at a more affordable cost.

Notary Journals

States require notaries to keep journals. These document every notarization that they perform. Your system compiles details of each notarization and saves this information for the notary. Every notary has a personal journal to which they only have access. The following are key details of notary journals:

- Notary journals are accessible through the Reporting tool. Each notary can access their journal just like any other report. The journal is accessed through Reporting, but you do not need to enable the journal in the team settings like you would other reports. Any user added to the notary team has access to their personal notary journal.
- Only the notary can download the contents of their journal. This may be a requirement if they leave your organization.
- If the rep leaves your organization, they can surrender ownership of their journal. Ownership can be transferred to another notary in your system, or the system administrator. Contact your CSM for more information on transferring ownership.
- Eltropy retains notary journals for 10 years as part of all notarization content.

Document Retrieval and Retention

The following are key details around Eltropy retaining documents and data, along with consumers retrieving their notarized documents:

- After completing the signing ceremony, the system provides the consumer an access PIN. The notary also prompts the system to send the consumer an email. This email contains an access key and a link to download the notarized document. The consumer must enter both the PIN and key to download their document.

Tip:

Train your notaries to emphasize the importance of saving the PIN. Consumers should keep PIN numbers with their records.

- If the consumer contacts your organization for a copy of the document, they must interact with the same rep who performed the notarization. The notary can resend the access details.
- By law, Eltropy retains all notarized documents and correlating data for 10 years.
- You can notarize two types of documents: public and private. Public documents are documents that you supply, such as a loan document or title transfer. Private documents are documents that the consumer brings to be notarized. You cannot access private documents. You can access public documents through the Session Review report; every notarization also generates a Session Review report, just like any other interaction. Because public documents are part of the Session Review report, if you have a custom export enabled, these notarized documents will be exported.

Set Up POPnotary

Required Access: Company Settings, Teams, Employees

Before performing the following steps, work with your CSM to enable *POPnotary*, *POPverify*, and call & audio recording.

Configure Multi-factor Authentication

Multi-factor authentication requires your reps to enter a code after signing in to the system. The system sends a code to the email in their profile, which the rep must enter into the authentication page.

Tip:

Before setting up MFA, verify that your users' email addresses are up to date in their profiles. The system sends the MFA access code to the address in their Support Center profile.

1. In your Support Center, navigate to your general settings (menu > **Administration Pages** > **Company Settings** > **General Settings**).
2. Enter a value greater than 0 in **MFA Access Code Timeout (minutes)**. This setting determines the number of minutes that the emailed code is valid. After this amount of time has passed, the user must request a new code.
3. Enter a value greater than 0 in **MFA Timeout (minutes)**. This setting determines the number of minutes for which the authentication is valid. If a user logs out then logs back in within this amount of time, they will not need to enter a code again. For example, if you set the timeout to **10**, a user can log in and out as many times as they need to within 10 minutes. Each login during the 10 minutes will not require a code.

Commonly-used timeout amounts are 4 hours (twice per business day) for the **MFA Timeout** and 10 minutes for the **Access Code Timeout**.

Configure Notary Representatives

Commissioned notaries must be added to a team with the Notary permission enabled. After setting up the notary reps, the notaries can begin configuring their notary profile. See the *Notary Certification*

Requirements section above for information on required documents and certifications that the notaries must obtain and upload. Instructions for setting up a notary profile are in the *POPnotary - Representatives* document.

1. Create a notary team:

Note:

Your Eltropy support rep may have already created a notary team for you. If so, you can skip this step.

- a. Navigate to the Team Directory (menu > **Administration Pages** > **Teams** > **Manage Teams**).
- b. Click the green add button ().
- c. Name the team.
- d. Enable the [Notary](#) permission.
- e. If you want this team to display on your Team selection pages, allowing the team to be called directly, enable [Company Contact](#).
- f. If you want to, you can configure other details such as adding a description that appears on the Team selection page.
- g. Click Save ().

2. Add notary reps to the team:

- a. Navigate to the Employee Directory (menu > **Administration Pages** > **Employee Directory**).
- b. Find the rep who will perform notarizations and click **Edit**.
- c. In the **Team(s)** column, click the add button (). A new secondary team is added to the rep's account.
- d. Click the newly-added drop-down and select the team which you created in step 1.
- e. Click Save ().

Repeat step 2 for each rep who will perform notarizations.

Create Notary Templates

If your notaries repeatedly notarize the same type of documents, you can use signature templates to speed up the process. Instead of a rep mapping signatures to these documents during each notarization call, they can use the template.

WorkFlow administrators can create notary templates. They follow the same process as mapping other documents and creating a correlating WorkFlow. These documents must, however, have an additional mapped task for the notarization. For more detailed information on mapping documents and creating WorkFlows, contact your CSM for documentation.

To perform the following instructions, you must be assigned to a team with the WorkFlow Administrator permission enabled. Also, the instructions assume you are creating a template for a new document.

Tip:

Perform the following instructions in your demo environment. You must set up the document and WorkFlow in your demo environment, then publish it to your production environment.

Map the Notary Seal

1. In your POPI/o system, navigate to the Slide Manager (menu > **Slide Manager**).
2. Click the three-dots menu (⋮) for the **WorkFlow Admin** folder.
3. Click **Upload New Document**.
4. Click **Choose File** to browse for and select your desired PDF.
5. Enter a name for **New Title**.
6. Click the three-dots menu (⋮) for the document that you just opened.
7. Click **Map Signature**.
8. Add the notary seal:
 - a. Click **Action Menu**.

- b. Hover over **Notary** and click **Add Notary Seal**. An image of a notary seal appears on the document preview.
 - c. Position the notary seal on the document as desired.
 - d. Click the settings cog () of the notary seal.
 - e. Enter a descriptive caption. This appears to the rep during the WorkFlow.
9. If necessary, add the initial entries:
 - a. Click **Action Menu**.
 - b. Hover over **Initials** and click **Add Consumer Initials**.
 - c. Position the initials box to your desired location.
 - d. Click the settings cog () of the initials box.
 - e. Enter a descriptive caption. This appears to the consumer or rep during the WorkFlow.
 - f. Check that the correct signer is selected in the drop-down.
 - g. Repeat these steps for each instance of initials.
10. Add signature entries:
 - a. Click **Action Menu**.
 - b. Hover over **Signature** and click **Add Consumer Signature**.
 - c. Position the signature box to your desired location.
 - d. Click the settings cog () of the signature box.
 - e. Enter a descriptive caption. This appears to the consumer or rep during the WorkFlow.
 - f. Check that the correct signer is selected in the drop-down.
 - g. If necessary, click **Add Date** to add a date.
 - h. Repeat these steps for each instance of signatures.
11. Click **Save**.

Create the WorkFlow

To create a new WorkFlow, you must be the same user who mapped signatures to the document.

-
1. Navigate to the WorkFlow Admin tool (menu > **WorkFlow Admin**).
 2. Click **Create New Signature Flow**.
 3. Select the document that you created in the previous section.
 4. If necessary, update the name of the WorkFlow. By default, WorkFlows have the name of the mapped document.
 - a. Click **edit** beside the document name.
 - b. Enter a descriptive name. This appears to reps in the WorkFlow list.
 5. Assess the flow of tasks in the workspace. After mapping the document, the system auto-generates tasks for each mapped item.
 6. If necessary, re-order the tasks to your desired flow.
 7. Click **Save**.
 8. Test the WorkFlow.
 9. When the flow is ready for production, click **Go LIVE** in the WorkFlow Admin tool.
